

# <u>Hydrogen Release Compound</u> (HRC-X<sup>®</sup>)

## PCE and TCE Remediation at a Dry Cleaning Facility

### SITE SUMMARY

A focused Site Investigation was completed for a dry cleaner site in Portland, OR. Results showed contamination levels of PCE as high as 120,000 ug/L in groundwater and 320,000 ug/L in soil. It is believed that the source of the contamination was a leaking sewer line beneath the facility. The high concentrations suggested the presence of Dense Non-Aqueous Phase Liquid (DNAPL) and a remedial technology was needed to address the distinctive contaminant concentrations. The HRC<sup>®</sup> application at this site is significant since it was the first time HRC-X<sup>®</sup> was injected, along with HRC, to treat VOCs. The extended life expectancy of HRC-X, 2 times-3 times that of HRC, made for a feasible option to reduce the high concentration of PCE. A pilot study was implemented using HRC to target the area near wells MW-1, MW-2, and MW-4 while HRC-X was injected near JEMW-4, the projected area of DNAPL.

### **REMEDIATION APPROACH**

- <sup>3</sup>⁄4 **Remediation Objective**: Pilot Study to prove HRC applicability at the site.
- 3/4 **Application Type:** Grid (Direct-Push Injection) for both applications
- 3/4 **Product:** HRC and HRC-X
- <sup>3</sup>⁄<sub>4</sub> **Quantity Applied:** 1,920 lb of HRC and 1,680 lb of HRC-X
- 3/4 Application Rate: HRC 6 lb/ft; HRC-X 9 lb/ft
- <sup>3</sup>⁄<sub>4</sub> **Injection Spacing:** Variable distances, see site map
- <sup>3</sup>⁄<sub>4</sub> **Product Cost:** \$11,520 HRC; \$11,760 HRC-X

### SITE CHARACTERISTICS

#### General

- 3/4 Name: Springdale Cleaners
- <sup>3</sup>⁄<sub>4</sub> Location: Portland, OR
- <sup>3</sup>⁄<sub>4</sub> **Industry:** Dry Cleaning
- 3/4 Contaminants of Concern:

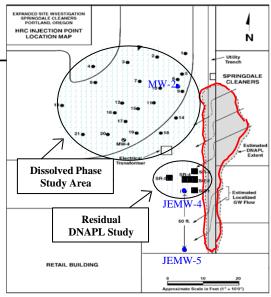

Contaminant	MW-2	JEMW-4	
	Concentrations	Concentrations	
PCE	11,600 µg/L	98,000 μg/L	
TCE	330 µg/L	8,300 μg/L	

### Hydrogeology

- **<sup>3</sup>⁄<sub>4</sub> Treatment Area:** 9,100 ft<sup>2</sup>
- <sup>3</sup>⁄<sub>4</sub> Soil Type: silty clay and silty sand
- 3/4 Groundwater Velocity: 0.68 ft/day
- 3/4 Groundwater Flow Direction: Southwest
- 3/4 Depth to Groundwater: Variable

Table 1. Cleanun Coals

Table 1. Cleanup Goals				
Contaminant	Concentration			
PCE	5 μg/L			
TCE	5 μg/L			
DCE	70 µg/L			
VC	2 µg/L

#### **RESULTS**

_	Percent Contaminant Reduction		Post Treatment Concentrations		
	Contaminant	Percent Reduction	Contaminant	Concentration	
MW-2	PCE	99%	PCE	<10 µg/L	
	TCE	64%	TCE	120 µg/L	
JEMW-4	PCE	99%	PCE	2.9 μg/L	
	TCE	99%	TCE	1.2 μg/L	

#### **Concentrations vs. Time**

#### CONCLUSION

HRC performance in MW-2 produced sustained degradation of PCE and TCE as well as their breakdown products over roughly a two year period (Graph 1). HRC metabolic acids peaked around 1300 mg/L after a year then tapered off over time (Graph 2). HRC-X performance in JEMW-4 and JEMW-5 indicates unprecedented performance in terms of contaminant reduction and total metabolic acid production and longevity. JEMW-4 shows significant reductions in high concentrations of 100,000 ug/L PCE to near non-detect (ND) levels in approximately 300 days (Graph 3). PCE levels continue to remain at very low levels for greater than 5 years after HRC-X application. TCE was also reduced significantly from 90,000 ug/L to approximately 35,000 ug/L in close to 4 years. Daughter products such as cis-DCE and VC have been produced as a result of the parent product breakdown and are eventually expected to dissipate. Metabolic acids remain high (1000 mg/L) as a result of the HRC-X application. HRC-X continues to reduce high concentration PCE and daughter products TCE, cis-DCE, and VC more than 5 years after injection.
